

Bug report id: BR01

Title: List of test cases missing test\_case\_id fields after sending GET request to “/test-cases”

Description: “/test-cases” endpoint have to return name, priority and test\_case\_id for each test case in the list.

Pre-conditions: User already logged in. At least one test case is created.

Steps to reproduce:

1. Send GET request to “/users” with curl request:

```
"curl --location 'http://127.0.0.1:8000/test-cases'\n--header 'Authorization: Bearer <TOKEN>'"
```

Actual result: "200 OK" response from server with list of test cases with their **name**, **priority** in the response body.

Expected result: "200 OK" response from server with list of test cases with their **name**, **test\_case\_id** and **priority** in the response body.

Attachments:

```
[{"name":"test case creation","priority":"MEDIUM"}, {"name":"test case creatio\n","priority":"MEDIUM"}, {"name":"test case creation","priority":"MEDIUM"}, {"nam\n":"test case creation","priority":"MEDIUM"}]
```

Bug report id: BR02

Title: It is possible to create a new step with test case id corresponding to one test case and next\_step\_id corresponding to step from other test case

Description: This lack of validation leads to case, when two steps from different test cases are connected(attachments), what results in breaking logic for other functionalities.

Pre-conditions: User already logged in. Two test cases are created.

Steps to reproduce:

1. Send POST request to "/test-cases/{test-case-id}/steps/" with test case id of already existing test case #1 and step id of first step as prev\_step\_id, associated with test case #2.

```
Curl request: "curl --location 'http://127.0.0.1:8000/test-cases/{test-case-id}/steps/' \n--header 'Authorization: Bearer <TOKEN>'\n--header 'Content-Type: application/json' \n--data '{\n  \"description\": \"new tc2\",\n  \"expected_result\": \"do this and do that\",
```

"prev\_step\_id": "{id of step from other test case}"}

Actual result: "200 OK" response from server received.

Expected result: "400 Bad request." response from server with "Can't create step. Steps must correspond to test cases." received in the response body.

Additional info: The same logic should apply to next\_step\_id, prev\_step\_id and if both are used.
